The term “cloud computing” describes a mode of data center and application resource management that enables organizations to quickly provision computing resources on a demand basis. Typically, cloud computing systems allow access to application resources through a secure gateway, or “cloud gateway”. A cloud gateway may be located at a perimeter of the data center or may be a networked device configured to provide a gateway for the data center. Additionally, the term “cloud” may be used to describe a computing environment that includes a data center, with the cloud computing environment providing access to one or more cloud services to users. For example, the term “cloud” is used herein to describe computing and storage services that are provided by a third-party provider. In general, access to data stored in a cloud is provided through a “cloud gateway”, i.e., the gateway that provides access to data in the cloud. The cloud gateway may be physically located at the perimeter of a data center or may be a networked device that provides a gateway to the data center. The cloud gateway is configured to securely manage access to the data in the cloud.
