cancer cell proteome in the era
of "omics" science. In the past

decade, the field of proteomics has rapidly evolved from the study of individual proteins to a comprehensive study of the complex protein expression patterns associated with biological processes and disease. In this review we examine the global changes that occur in the cancer cell proteome, how these

are linked to cellular physiology and how they may be exploited for a therapeutic advantage. We provide a survey of the latest advancements in proteomics and the strategies that are currently being explored to make this important field more accessible to the biology researcher.1. Field of the Invention This invention

relates to the field of biologically active materials. More particularly, the invention is directed to substituted polypeptides and the compositions, methods and kits comprising the same. 2.

Description of Related Art

Hormone therapy has proven to be an effective treatment for a

variety of medical disorders and symptoms, including, for example, hirsutism, virilization, and various menstrual problems. Often, the therapy is systemic, involving the administration of a biologically active hormone by injection. In some cases, hormone therapy may be less than optimal. For example, some

hormone therapies require injections on a regular basis. Many patients find injections to be inconvenient and/or painful, and therefore, may not complete a prescribed course of hormone therapy. Additionally, many patients would prefer oral administration of a hormone to reduce the need for injections

and the discomfort associated therewith. The art desires alternative compositions and methods of administration of hormones that mimic the beneficial effects of systemic hormone therapy but do not cause the side effects associated therewith. Oral hormone therapies also are known. For

example, U.S. Pat. Nos.
5,674,908 and 5,728,408
