The Essential Guide to Quantum Error Correction: An Annotated Bibliography Based on the 13th International Conference on Quantum Error Correction in London, United Kingdom, December 9-14, 2013 Manas Das and S. H. Tan

Abstract: In this paper, an annotated bibliography is presented to aid researchers in their endeavors to acquire a better understanding of quantum error correction. The subject is not new and is the subject of many review papers in the literature; however, in spite of being the subject of the majority of modern quantum communication protocols, we believe that this subject still warrants more attention. Moreover, by having a general background on the subject, we are better equipped to acquire a holistic understanding of the subject. A major goal of this work is to encourage researchers to engage more with the subject so that we can continue to build the foundation for this ever-

evolving discipline. Introduction Today, the advent of quantum information processing has led to the rapid emergence of a new, highly-organized field of research called quantum information theory. With various quantum technologies in the foreground of modern developments, quantum information processing has revolutionized our approaches to basic tasks, with applications ranging from secure communications to quantum computation. Quantum information processing has also inspired a number of engineering and physical constructions. For instance, by exploiting the principles of quantum mechanics, quantum processing makes it possible to build superconducting hardware capable of processing quantum information. The vast majority of quantum information processors today, for example, are based on superconducting electronic circuits. Among these ideas, perhaps, the most mysterious and difficult aspect is the quantum nature of quantum information. No classical system is stable under time evolution due to the famous uncertainty principle. The overwhelming majority of quantum states that one encounters in a typical quantum information processor is therefore in a superposition, a state that is made up of two or more classical quantum states. In quantum information

theory, one of the most important tasks for an ideal quantum information processor is to maintain quantum coherence in the presence of noise and errors
